                                                                                                                                                                                                                         The invention provides a composition comprising one or more antisense oligonucleotides directed against vascular endothelial growth factor (VEGF) where the antisense oligonucleotides inhibits proliferation of cells exhibiting autocrine VEGF activity at an IC 5 0 concentration of between 0.5-2.5 micro Ma. The antisense oligonucleotides may be directed against VEGF for inhibiting cancer cell proliferation and angiogenesis. Preferably the oligonucleotide AAH23032 (a modified version of AAH22984) is used and may be utilized to treat Kaposi's sarcoma, ovarian cancer, prostrate cancer, pancreatic cancer or melanoma. Sequences AAH23012-023 represent gene-specific primers used in RT-PCR amplification of VEGF
                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense oligonucleotides useful for inhibiting vascular endothelial growth factor expression, angiogenesis and for treating cancer, e.g., Kaposi's sarcoma, ovarian cancer and prostrate cancer

                                                                                                                                                                                                                                                                                                                                                                                     cellular proliferation and preventing angiogenesis. The present sequence is a reverse transcriptase (RT)-PCR primer for a VEGF or related gene, used to clone the coding region for expression in tumour cell lines. The cell lines were used to test prospective antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a composition comprising an antisense oligonucleotide directed against vascular endothelial growth factor (VEGF). The antisense oligonucleotide is useful for preparing a composition treating cancer, neoplastic proliferation, abnormal

They can always use related hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes the rat Nurrl coding and protein sequences. The Nurrl protein is involved in the induction of tyrosine hydroxylase expression in adult rat-derived hippocampal progenitor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cell comprising exogenous nucleic acid inducing tyrosine hydroxylase expression useful for treating catecholamine-related diseases such as

used to screen for compounds that affect mammalian cell cycle regulatory or proteins. The method comprises administering a compound to a cell line, which contains a reporter gene linked to an Upstream Activation Sequence (CAS) and a promoter, where the UAS binds a transcription control factor (TCF) which is regulated through cyclin/cyclin-dependent kinase (CDK) phosphorylation. Also included in the construct is an effector gene providing a gene product to permit normal cyclin/CDK regulation of the reporter gene is then analysed in the cell line, TCF. Expression of the reporter gene is then analysed in the cell line, thereby determining whether the compound affects the normal regulation. The method can be used to identify inhibitors and activators of cyclins, CDKs, cyclin/CDK complexes, cyclin kinase inhibitors (CRIs), and cyclin/CDK/CKI complexes. The identified agents can be used for stimulating growth of cells (as in wound healing), or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening for agents that effect cell cycle regulatory proteins using a cell line that expresses a reporter gene in response to regulation through phosphorylation by a cyclin/CDK system

It was used with AAQ33180. To obtain DNA sequence adjacent to the exons of the gene, sequencing substrate was obtained by inverse PCR amplification of DNAs from two YACS 310D8 and 183H12 that span the deletions. Ligation at low concentration cyclized the restriction enzyme digested YAC DNAs. Oligonucleotides with sequencing tails designed in inverse orientation at intervals along the cDNAs primed PCR amplification from the cyclised templates. Comparison of these DNA sequences with the cDNA sequences placed exon boundaries at the divergence points. NOTE: The sequence as given in the specification is barely legible. See also AAQ33158-253.

(Updated on 25-MAR-2003 to correct PN field.)

The method comprises comparing APC gene coding sequences or mRNA in a non-neoplastic tissue, where a difference indicates an APC gene associated meoplasia of the tumour tissue. APC is a tumour repressor expressed in most normal tissues. APC mutations are found in familial adenomatous polyposis and sporadic colorectal cancer patients. The method enables mutations to be detected to provide an indication of predisposition to

The method comprises comparing APC gene coding sequences or mRNA in a tumour tissue, to APC gene coding sequences or mRNA in a non-neoplastic tissue, where a difference indicates an APC gene associated neoplasia of the tumour tissue. APC is a tumour repressor expressed in most normal tissues. APC mutations are found in familial adenomatous polyposis and sporadic colorectal carger patients. The method enables mutations

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel method for detecting Adenomatous CC Polyposis Coli (APC) protein in a sample. The method involves CC contacting the sample with antibodies which specifically binds to the CC 2843 amino acid form of the human APC protein, or to a mutant APC 2843 amino acid form of the human APC protein, or to a mutant APC CC gene play a role in tumorigenesis, indicating that it is a tumour CC suppressor gene. It is located on chromosome 5q21, which corresponds to the FAP (familial adenomatous polyposis) locus. FAP is an autosomal CC dominant inherited disease in which affected individuals develop CC hundreds to thousands of adenomatous polypos in the colon and rectum, cc some of which progress to malignancy. The FAP locus is often found to be deleted in sporadic (i.e., non-familial) adenomas and carcinomas, and chromosome 5g deletions have also been observed in tumours of the lung, CC and in leukaemias and lymphomas. Although the FAP locus contains cc several other genes such as FER, TB1, TB2, and MCC, it is thought that that mutations in the APC gene play a key role in the development of FAP and Sporadic tumours. The method is useful for detecting APC protein and its mutations in the APC gene play a key role in the development of FAP and Sporadic tumours ample. The method is useful for diagnosing or CC cancer, for detecting germline and somatic alteration of wild-type APC genes, and for testing therapeutic agents for the ability to suppress cumours. Sequences AAA93500-A93577, AA93582-A93585 and AAA93602-A93615 represent PCR primers used in exemplifications of the human APC gene (also referred to as the DP2.5 gene in the specification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ş

The method involves detecting somatic alteration of wild-type adenomateus polyposis coli) protein in a tumour tissue isolated from a human (the alteration indicating neoplasia of the tissue). The method of the invention is useful in diagnosis or prognosis of a neoplastic tissue of a human the method is useful in detection of genetic predisposition to cancer. The present sequence represents a DNA sequence used in the method of the invention of the inv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Albertsen H

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The method can be used to identify inhibitors and activators of mammalian cell cycle regulatory proteins, especially inhibitors and activators of cyclins, CDKs, cyclin/CDK complexes, cyclin kinase inhibitors (CKIs), and cyclin/CDK/CKI complexes. The identified agents can be used for stimulating growth of cells (as in wound healing), or regulating excessive cell growth and division (as in cancer therapy).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primers AAV60724-V60725 were used to PCR amplify codons 1-151 of the human cyclin-dependent kinase 2 (hCDX2). The amplified product was used to generate a fusion protein comprising part of the hCDX2 sequence linked to codons 155-302 of the yeast PHO85 gene. The fusion protein is used to screen for compounds that affect mammalian cell cycle regulatory protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              proteins. The method comprises administering a compound to a cell line, which contains a reporter gene linked to an Upstream Activation Sequence (UAS) and a promoter, where the UAS binds a transcription control factor (TCF) which is regulated through cyclin/cyclin-dependent kinase (CDK) phosphorylation. Also included in the construct is an effector gene providing a gene product to permit normal cyclin/CDK regulation of the reporter gene is then analysed in the cell line, thereby determining whether the compound affects the normal regulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Screening for agents that effect cell cycle regulatory proteins using a cell line that expresses a reporter gene in response to regulation through phosphorylation by a cyclin/CDK system
Identifying and characterizing cells by comparing the pattern gene expression in a selected gene family
                                                                                                                                                                                                                                                                                                                                                                                                        Genetic proximity; gene expression; cell characterisation; homeobox gene, genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR;

They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences ARZ17803-218342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor superfamily genes or cadherin superfamily genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genetic proximity; gene expression; cell characterisation; homeobox gene; genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR; kinase gene; protein phosphatase; P450; steroid receptor; cadherin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is
                                                  Identifying and characterizing cells by comparing the pattern gene expression in a selected gene family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      08-JUL-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene

  The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZI7803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, PCS enzyme genes, steroid
                                                                                                                                                                                                                                                                                                                       Identifying and characterizing cells by gene expression in a selected gene fami

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used fo obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene
                                                                                                    The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent k other than cell-cycle dependent kell-cycle dependent kell-cycle dependent kell-cycle pendent kell-cycle pen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             04-DEC-2000
                                                The ribozyme is resistant to endon efficient in restenosis treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinase clbr. PCNA and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells.

                                                                                                                                                                                    The present invention describes a method for treating a proliferative CC skin or eye disease and scarring. The method involves administering a CT ribozyme (I) which cleaves RNA encoding a cytokine involved in CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle concleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, antisickling, CC dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, CC ophthalmological, vulnerary, keratolytic and virucide activities, and CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, CC squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing such as keloid, adhesion and hypertrophic or hypertrophic burn carring such as keloid, adhesion and hypertrophic or hypertrophic burn carring such as keloid, adhesion and hypertrophic burn the

                                                                                                                                                                                                          Ş
                                                                                                                                                                                                                                                                                                                     inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, antiseborrheic, antidiabetic, antisickling, cophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, cyuamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 represent sequences used in the

New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. diabetes, multiple sclerosis, atherosclerosis, cancer, infections, osteopor Parkinson's disease osteoporosis

Example C; Page 200; 266pp; English.

The present invention relates to a new polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX nucleic acids, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as cancers, Hodgkin disease, preventing or diagnosing diseases such as cancers, Hodgkin disease, von Hippel-Lindau syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxiatelangiectasia, leukodystrophies, addiction, anxiety, depression, pain, obesity, Crohn's disease, osteoporosis, inflammatory bowel disease, bowel disease, atherosclerosis, hypertension

                   The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Genetic

The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell iderentiation, cell proliferation, hasmatopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The nucleic acids are used in the hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present nucleic acid sequence represents a PCR primer that was used in the methods of the invention for amplification
                                                                                                                                                                                                                                          Claim 4;

an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used fo obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ170803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox gene kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor superfamily genes or cadherin superfamily genes.
                                                                                                                genes

Identifying and characterizing cells by comparing the gene expression in a selected gene family pattern o H

Claim 4; Page 42; 102pp; English.

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for cells capable

The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAS17803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor superfamily genes or cadherin superfamily genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genetic proximity; gene expression; cell characterisation; homeobox gene, genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR; kinase gene; protein phosphatase; P450; steroid receptor; cadherin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
               The invention provides a new method for identifying and characterising CC cells. The method for determining the genetic proximity of a first cell cc and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a CC proximity index using a specified formula. The methods can be used for CC characterising cells, e.g. for determining the origin of a cell, its CC genetic status, whether it carries a genetic defect, or whether it is CC transformed. They can be used for detecting a selected genetic defect in CC an individual, e.g. a fetus. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired concepts. The method uses reverse transcriptase polymerase chain CC property. The method uses reverse transcriptase polymerase chain CC selected gene family. Sequences AAZ17803-Z18342 represent primers that CC can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, transity and property can also be concept.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The gene family can be selected from a set of homeobox ge kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor superfamily genes or cadherin superfamily genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    11-OCT-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           श
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SXS
                                          The invention provides a new method for identifying and characterising CC cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its compared to the continuous cell in the continuous cell in the continuous cell in the continuous cell in the cell in the continuous cells. They can selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain creation (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-Z818342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Genetic proximity; gene expression; cell characterisation; homeobox gene; genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                           The invention provides a new method for identifying and characterising CC cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second CC and a second cell comprises: (a) obtaining the second cell the pattern of cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a CC proximity index using a specified formula. The methods can be used for CC characterising cells, e.g. for determining the origin of a cell, its CC genetic status, whether it carries a genetic defect, or whether it is CC transformed. They can be used for detecting a selected genetic defect in CC transformed. They can be used for determining the cell they can also be used for ceffect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired CC property. The method uses reverse transcriptase polymerase chain CC reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-Z18342 represent primers that CC can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid CC receptor superfamily genes or cadherin superfamily genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches 17;

                                                                                                                                The invention provides a new method for identifying and characterising CC cells. The method for determining the genetic proximity of a first cell cand a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its craniformed. They can be used for detecting a selected genetic defect in an individual. e.g. a fetus. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for cobtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain creation (RT-pCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-Z18342 represent primers that can be used in the RT-pCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, chain creeptor superfamily genes or cadherin superfamily genes, steroid contents of the content of the pattern of gene capable of contents to determine the pattern of gene capable of capable of

                                                                                                                                                                                                                                                                                                                      The invention relates to antisense oligonucleotides that detect and modulate the expression of Jun N-terminal kinase (JNK) proteins. The oligonucleotides specifically hybridize to a nucleic acid encoding a NK1, JNK2 or JNK3 protein, and which modulate expression of these proteins. The oligonucleotides are useful for modulating JNK protein expression and cell cycle progression in cultured cells or animal cells. The oligonucleotides are also useful for modulating the phosphorylation of a protein that has been phosphorylated by a JNK protein, and the expression of a cellular protein that promotes one or more metastatic events. The oligonucleotides also form pharmaceutical compositions for treating animals with a hyperproliferative disease, and for inhibiting terms are animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense oligonucleotide; Jun N-terminal kinase; JNK; hybridise; JNK1; JNK2; JNK3; cell cycle progression; phosphorylation; tumour; probe; hyperproliferative disease; human; ss.

The present sequence is one such antisense oligonucleotide. The oligonucleotides of the present invention are useful for treating diseases or conditions with reduced apoptosis, e.g. cancer and cellular hyperproliferation. The oligonucleotides may also be used to increase the stimulation of apoptotic proteins, e.g. for treating Alzheimer's or Parkinson's disease, amylotrophic lateral sclerosis, retinitis, pigmentosa, epilepsy, myocardial infarction, stroke, obstructive jaundice, polycystic kidney and diabetes. The present

The stem cells can be used to CC generate a population of mammalian motor neurons by incubating the stem cells in a medium promoting cell proliferation and neuronal cells in a medium comprises laminin-coated plates and NEP comedium lacking chick embryo extract. The stem cells can also produce neural crest stem cells by inducing the cells to differentiate in vitro. The inducing step comprises replating the cells to a laminin-coated comprises replating the cells on a laminin-coated comprise stem cells of the comprise comprise conding a dorsalizing agent to the cells, preferably fibroblast comprise conduce cells (BMP) such as BMP-2, -4 or -7. The stem cells can be used to produce cells of the peripheral nervous system, by inducing the stem cells to differentiate in vitro to neural crest stem cells, and inducing these cells to differentiate in vitro to neural crest stem cells, primers cells, and inducing these cells to differentiate in vitro to neural crest stem cells, and inducing comprise cells to differentiate in vitro to neural crest stem cells, and inducing comprise cells to differentiate in vitro to neural crest stem cells, and inducing comprise cells and chick embryons to have one cells and inducing comprise cells and chick embryons and chick embryons and inducing comprise cells and chick embryons and cells, and inducing comprise cells and chick embryons are cells and chick embryons and chick embryons and chick embryons and ch

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes the preparation of immortalized human hair papila cells (HPC). The method comprises transformation of HPC with an SV40 viral Large T-antigen gene with deleted replication initiation point. The immortalized HPC can be used in a screening method for a hair growth agent, by culture of immortalized HPC in the presence of a substance to be tested and observation of the growth of the immortalized HPC. HPC is also used in development of hair growth stimulating agents. The present sequence represents a PCR primer, which is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immortalized human hair papila cells used for evaluation growth agent - are prepared by transformation of human ha cells with gene with deleted replication initiation point
                        Cell comprising exogenous nucleic acid inducing tyrosine hydroxylase expression useful for treating catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrenia -

The Nurr1 protein is involved in the induction of tyrosine hydroxylase expression in adult rat-derived hippocampal progenitor cells. The Nurr1 gene and protein can be used in the treatment of catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrenia. They can also be used to induce tyrosine hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       modified_base

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to antisense compounds targetted to nucleic acid encoding RECQL2 (gene associated with Bloom's disorder) to inhibit the expression of RECQL2. Antisense compounds of the invention are useful for treating diseases associated with expression of RECQL2, in humans. They are useful for diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human

of receptor tyrosine kinase (Ret) expression. GDNP (glial cell line-derived neurotrophic factor) is a transforming growth factor-beta family related neurotrophic protein. GDNP action is thought to act through GBP-anchored GDNP family receptor alpha-1 (GPRalphal) and Ret. The PCR primer represented by this sequence is used in an example of the method of the invention. The method is used to identify compounds that are agonists or antagonists of intracellular signalling effected by glycophosphatidyl-inositol (GPI)-anchored receptors in cells of the nervous system. Ret-independent signalling gathways may stimulate neurotransmitter synthesis. The compounds identified by the method of the invention can be used for protecting auditory neurons, improving learning ability, treating epilepsy and treating Parkinson's disease. The present sequence represents a PCR primer used in the RT-PCR analysis tyrosine kinase (Ret) expression. GDNF (glial cell

```

US6165786-A. Homo sapiens

mmune disorder;

phosphorothioate; antisense oligonucleotide; ss.

03-NOV-1999; 03-NOV-1999; 26-DEC-2000. 9908-0433699 9908-0433699

CF, SISI Cowsert LM; PHARM INC.

WPI; 2001-079848/09

hybridizes with for modulating t Claim 14; Column 41-42; 41pp; English Novel antisense compound targeted to human nucleolin which specifically the and inhibits the the expression of expression nucleolin i 'n of human nucleolin, useful in cells -

Nucleolin is a member of the Ag-NOR (active ribosomal gene located in the nucleolar organiser region) family of proteins which are markers of active ribosomal genes, and whose expression is associated with the prediction of tumour growth rate. The presence of antibodies against nucleolin are associated with systemic connective tissue diseases such as systemic lupus erythematosus (SLE) and scleroderma-like chronic graft versus host disease. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences AAC92560-C92639 represent antisense oligonucleotides targetted to the human nucleolin gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human nucleolin mRNA, and were analysed for their effect on nucleolin mRNA levels by quantitative real-time PCR. Nucleolin (also known as P92 or C23) is the most abundant nucleolar phosphoprotein in actively growing cells. Nucleolin primarily participates in ribosome biogenesis and transport of ribosome to provide the primarily participates in ribosome biogenesis and transport of ribosome to provide the primarily participates and transport of ribosome being able to

                                                                                                      This invention describes novel Staphylococcus-specific oligonucleotides based on the consensus femA nucleotide sequence which are used to develop products for the identification, detection and therapy of infections. The oligonucleotides can be used for the genetic amplification, the identification and/or quantification of various femA sequences which are specific to known or unknown Staphylococci species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      acetaminophen, and paranitrophenol. Several of the nucleotide changes identified at the polymorphism sites, give rise to an amino acid change. Amino acid changes to the polymorphism sites, give rise to an amino acid change. Amino acid changes may result in altered enzyme activity. The sequences can be used as probes for detecting STP2 polymorphisms. The polymorphic probes are used in screening and genotyping, i.e. to predict the rate of metabolism of STP2 substrates, potential drug-drug interactions and adverse side effects. They can also be used to detect diseases resulting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequences AAZ59305-Z59352 are fragments of the human STP2 gene. fragments are from the 8 exons, the promoter region, 3' and 5' untranslated regions of the STP2 gene Bach sequence contains a identified STP2 gene single nucleotide polymorphism (SNP). STP2 phenol sulphotransferase. Substrates for STP2 include minoxidil, phenol sulphotransferase. Substrates for STP2 include minoxidil,
              Since the femA sequence is similar to the femB sequence, the oligonucleotides can also be used for the molecular genotyping of femB genes of different Staphylococci species or other gram-positive bacter. The femA nucleic acids can also be used in therapeutic applications. They can also be used to identify inhibitors, e.g. antibodies or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAX37791 standard; DNA; 21 BP

restenosis treatment.

designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin BI. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787 The ribozyme of the invention is useful for

The present invention relates to a hairpin or hammerhead ribozyme,

AAA8415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   resistance (mdr-1) mRNA specific ribozymes remove the mechanism of drug resistance used by transformed cells and thus enhances drug therapies for tumours. The ribozymes may also be used to study genetic drift and mutations within cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the invention. The ribozymes is formed in a hammerhead motif, but may also be formed in the motif of a hairpin, hepatitis delta virus, group I intron or RNaseP-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expressed in pre-neoplastic and transformed cleavage of target mRNAs expressed in pre-neoplastic and transformed cells elicits inhibition of the transformed state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, antisickling dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; head cell carcinoma;
                                                                  also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of grematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scarr. AhH57577 to AhH62099 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent
                                                                                                                                                                                                                                            dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can appear to the contraction of the contraction
                                                        exemplification of the

                                                                                                                                                                                                                              useful for the treatment of asthma and in gene the ripper. IZEC-CIM is of allergic diseases. IZEC-CIM blocks IgE binding to mast cells/basophils 10000 fold better than native soluble CD23, and has comparable blocking and binding efficiency to antibodies, but without any side effects. Sequences AAZ07939-946 represent PCR primers used in the preparation of chimeric CD23 constructs.

The products and methods can be used for the diagnosis of subjects with LQT syndrome. They can also be used to screen for drugs for treating or preventing LQT syndrome. The HERG nucleic acids can also be used for gene therapy and HERG peptides can be used for peptides can be used for gene therapy.

expression of TERT, useful for modulating New compound targeted to nucleic acid molecule encoding telomerase transcriptase (TERT), which specifically hybridises with and inhibits apoptosis and inhibiting cell

Claim 26; Page 91; 154pp; English.

CC transcriptase, where the compound specifically hybridises with and CC inhibits the expression of TERT. A series of oligonucleotides were CC designed to target different regions of the human TERT RNA. These were CC 20 nucleotides in length and composed of a central gap region consisting CC of ten 2'-deoxynucleotides, flanked on both sides (5' and 3' directions) CC by five-nucleotide wings. The wings were composed of 2'-methoxyethyl CC (2'-mOE) nucleotides. The compounds were analysed for their effect on human TERT mRNA levels by reverse transcriptase (RT)-polymerase chain CC reaction (PCR). The compound is useful for inhibiting the expression of CC TERT in cells or tissues, for treating a human having disease or CC condition associated with TERT, for modulating apoptosis, for inhibiting CC cell growth (preferably, cancer cell growth), in antisense therapy and CC coligonucleotide used to modulate the activity of nucleic acid molecules CC encoding TERT, described in the method of the invention. to a nucleic acid molecule encoding human TERT (telomerase reverse The invention describes a compound, 8-50 nucleobases in length targeted

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits genetic linkage the genes

Example 10; Page 118; 714pp; English.

CC This invention relates to the sequence of an isolated nucleic acid CC molecule comprising at least one base variation from that of a known CC human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2), CC cytochrome P450 02E1 (CYP4502E1), advenergic receptor beta1 (ADBR1), CC aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator (C ARNT), cathepsin S (CTGS), cyclooxgenase 2 (COX2), diazepam binding cinhibitor (DBI), epoxide hydrocylase 2 (EPHX2), 5-lipoxygenase cc inhibitor (DBI), epoxide hydrocylase 2 (EPHX2), 5-lipoxygenase cc inhibitor (DBI), epoxide hydrocylase 2 (EPHX2), 5-lipoxygenase cc activating protein (FLAP), glutathione-S-transferase 12 (GST12), cc lipoxygenase (NDMT), (Kallikrein 2) KLK2, nicotinamide cc lipoxygenase cc (NDMT), NADPH quinone oxidoreductase 2 (NQO2), cc sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4 (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl transferase receptor (NPA), multidrug resistance cc (MT2B1), orphan nuclear receptor (NPA), or acetylcholine cc (MT2B1), orphan nuclear receptor (NRI12), or acetylcholine cc (MRS1) sequence. The polymorphisms in the human genes cited in the convertion are useful as genetic linkage markers for locating and cc the genome and eventually identifying the genes responsible for a cc variety of disorder-related traite as a result of their e-g., contained covertopression, constitutive expression, mutation or underexpression, which may be used in diagnosing and/or treating the disorders. The nucleic acid molecules comprising the polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1, ARNT, EPHX2, GST12, NNMT, NQO2, NR112, STM, UGT2B4, UGT2B7, UGT2B15, AHR, MDR1 and/or MDR3 are useful

The polymorphic sequences contained in CYP4501A1, CYP4501A2, AHR, MDR1 and/or MDR3 may also be used to screen individuals for susceptibility to cancer. Polymorphic sequences in ADRB1 or CHWR2 are used to screen for altered cardiovascular function, in COX2 for altered susceptibility to colorectal tumours, in DBI or CHWR1 for altered central nervous system function, in FLAP and HNMT for altered pulmonary, immunological or haematological function, in KLK2 for altered serine protease activity in the prostate, in LTF for altered immunological or haematological function, in CHWR3, CHWR4 or CHWR5 for altered central and peripheral
                                                                                  The present invention describes a new isolated nucleic acid sequence (I) comprising a DPP10 mRNA sequence. DPP10 is a dipeptidyl peptidase (also known as prolyloligopeptidase). (I) has antiinflammatory, antiasthmatic,
                                                                                                                                                                                                                                                                                                     New nucleic acid sequence comprising DPP10 mRNA, useful for the manufacture of a medicament for regulating DPP10 protein expression for preventing or treating inflammatory disease e.g., inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DPP10; dipeptidyl peptidase; prolyloligopeptidase; enzyme; asthma; antiinflammatory; antiasthmatic; antipsoriatic; antiarthritic; antitheumatic; vaccine; gene therapy; inflammatory disease; inflammatory bowel disease; atopy; rheumatoid arthritis; psoriasis

(I) c also be used in an assay for detecting or measuring DPP10 in a sample. A host cell comprising (I) can be used for producing recombinant DPP10 gene products, or in drug screening systems to identify agents for diagnosis or treatment of individuals having or susceptible to inflammatory disease. Human DPP10 is located on chromosome 2, more specifically chromosome 2q14. ABQB4254 to ABQB4612 and ABP55569 to ABP55629 represent sequences used in the exemplification of the present invention.
          The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. ANX67275 to ANX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                     Nucleic acid molecule modulating VEGF receptor(s) mRNA stability - useful for treating e.g. tumour psoriasis, rheumatoid arthritis, etc., in a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                       alkaloids; or (ii) involved in flower formation. AAV9592 to AAV96334, cand AAV96335 to AAV96354 represent potate solanidine glucosyltransferase hammerhead and hairpin ribozymes, respectively. AAV95629 to AAV95981, and AAV96355 to AAV96734 represent potato solanidine glucosyltransferase target sequences. AAV96773 to AAV97170, and AAV97171 to AAV97195 represent potato citrate synthase hammerhead and hairpin ribozymes, respectively. AAV96773 to AAV97772, and AAV97196 to AAV97120 represent potato citrate synthase target sequences. Ribozymes of the present invention can be used to inhibit the synthests of toxic alkaloids in solanaceous plants, particularly potato but also tomato, pepper, aubergine and ditura or to inhibit flowering in potato, lettuce, spinach, cabbage, brussel sprouts, arugula, kale, collards, chard, beet, turnip, sweet potato and turf grass. Also the ribozymes can be used for RNA manipulation in the same way that restriction endonucleases are for DNA, as well as to examine genetic drift and mutations in plants and to consensus sequences within a family of related genes, and being catalytic need to be present at only very low concentrations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
